THE HIGH VACUUM SECTION

- There were approximately 50 employees in the high vacuum laboratory. They plan to work on the development and production of all types of television and transmitter tubes. HASS, the chief of the section, had had success with his work on the development of infrared iconoscopes while in Moscow. Although iconoscopes were a bottleneck in Soviet Zone production, Dr. ECKHARDT, a specialist in the infrared field, came to our laboratories to work as a "free worker" and developed two satisfactory iconoscopes for use with normal light. It was said that after October 1952, 500 of these iconoscopes were going to be produced monthly. (These iconoscopes are for normal light use.) As stated previously, the offices of the radio broadcasting section was moved—to make way for this new high vacuum department.
- 6. In connection with the possible monthly production and use of 500 iconoscopes these iconoscopes will not be sent to the USSR since good quality Russian-made iconoscopes were in adequate quantity there. (These Russian iconoscopes had a life of approximately 300 hours.)

OPERATION AND PRODUCTION POTENTIAL

the small studio at Berlin-Adlershof will be ready to operate on an eight-hour day schedule in about one and a half years. By that time they will have two or three television cameras and the remainder of the organization will be operative.

for the artists were in the final stages of being completed and equipped. AUGUSTIN, a former motion picture executive, was the supervisor of the television studios.

function smoothly in spite of all difficulties. The lay-

out of these quarters was really much better than that of the FTZ.

the tecnnical installation and the stages were inferior to those at Adlershof.

8. The transmitter at Berlin-Adlershof was a provisional one; the regular one was not yet completed. There was some trouble with the transmitter.

25X1

it seemed that they had to go to the legal channel, number five, and the transmitter would not tune up that high. There was a second difficulty which had to do with the separation between the picture channel and the audiochannel. It was originally planned for a total band of five megacycles and the Soviets ordered that they go to six megacycles.
